

Using `cascadilla-xelatex-biblatex.cls`

András Bárány

1. Section heading

1.1. Immediate subsection heading

Some text.

1.2. Subsection following text

1.2.1. Immediate subsubsection heading

Some more text.

2. Citing other work

`cascadilla-xelatex-biblatex.cls` uses `biblatex` and `biber`. The class uses the `biblatex` implementation of the Unified Style Sheet for Linguistics.¹ Note that the bibliography styles **do not come with the class**: please download them from <https://github.com/semprag/biblatex-sp-unified/> and place the `.cbx` and `.bbx` files in the folder of your document (or the relevant folder on your system).

Here's an example in-text citation: É. Kiss (2008). By default, the bibliography file is assumed to have the same name as the `.tex` file, in this case `example.bib`. To change this, use `\addbibresource{...}` to specify the location of your bibliography in your preamble.

3. Comparison to `cascadilla.cls`

This class is heavily influenced by Max Bane's `cascadilla.cls`², but it (optionally) uses $\text{Xe}\text{L}\text{A}\text{T}\text{E}\text{X}$ and instead of (pdf) $\text{L}\text{A}\text{T}\text{E}\text{X}$ and (obligatorily) `biblatex/biber` instead of `natbib`.

It is also based on an arguably more recent version of the Cascadilla Proceedings Project style sheet.³

By default, the class uses the XITS fonts instead of Times (or Times New Roman) as you might not have Times (or Times New Roman) installed on your system (I don't). If you want to use Times New Roman instead, you can use the option `timesnewroman` when specifying the document class. You can also use specify your own Times-like font in the preamble using the usual `fontspec` commands.

4. Using this class for Cascadilla proceedings

I started modifying Max Bane's original class for my own use. There's no guarantee or proof (yet) that a file created using the current class will be accepted for actual proceedings published by the Cascadilla Proceedings Project, but that's the aim.
